Event Information:

Description:

This alert was triggered by an inbound email contains one or more external links due to potentially suspicious characteristics. As part of the investigation, check firewall or proxy logs to determine whether any endpoints have attempted to access the URLs in the email and whether those connections were allowed or blocked.

Your Amazon Package Couldn’t Be Delivered – Action Required

sender:

urgents@amazon.biz

recipient:

h.harris@thetrydaily.thm

attachment:

None

content:

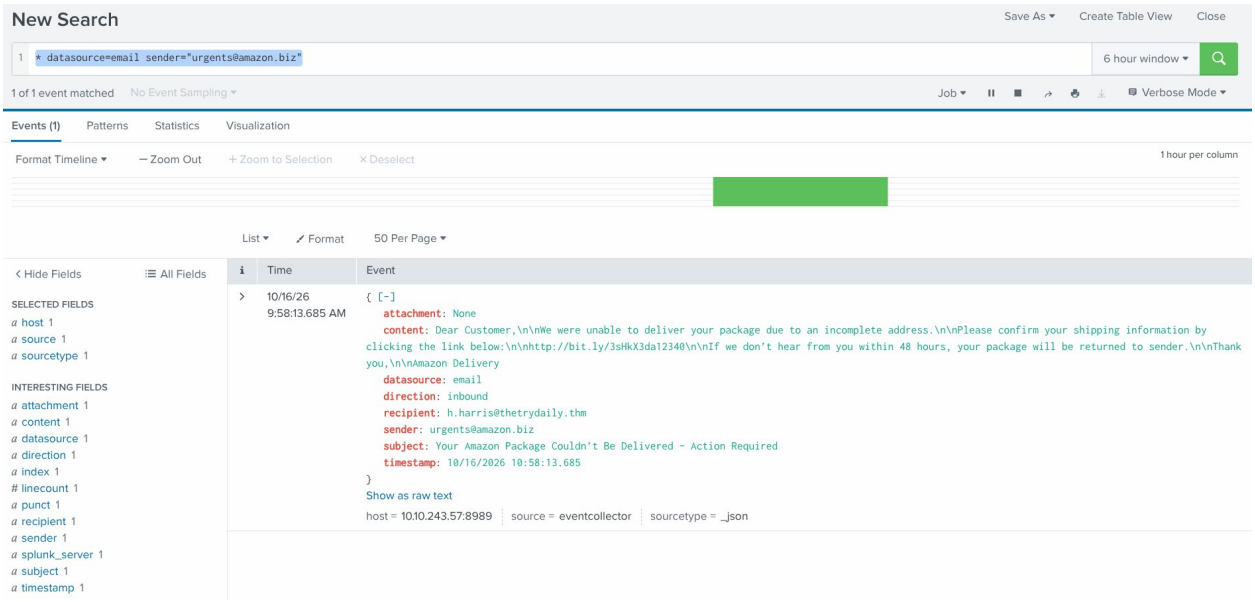

Dear Customer,\n\nWe were unable to deliver your package due to an incomplete address.\n\nPlease confirm your shipping information by clicking the link below:\n\nhttp://bit.ly/3sHkX3da12340\n\nIf we don’t hear from you within 48 hours, your package will be returned to sender.\n\nThank you,\n\nAmazon Delivery

direction:

Inbound

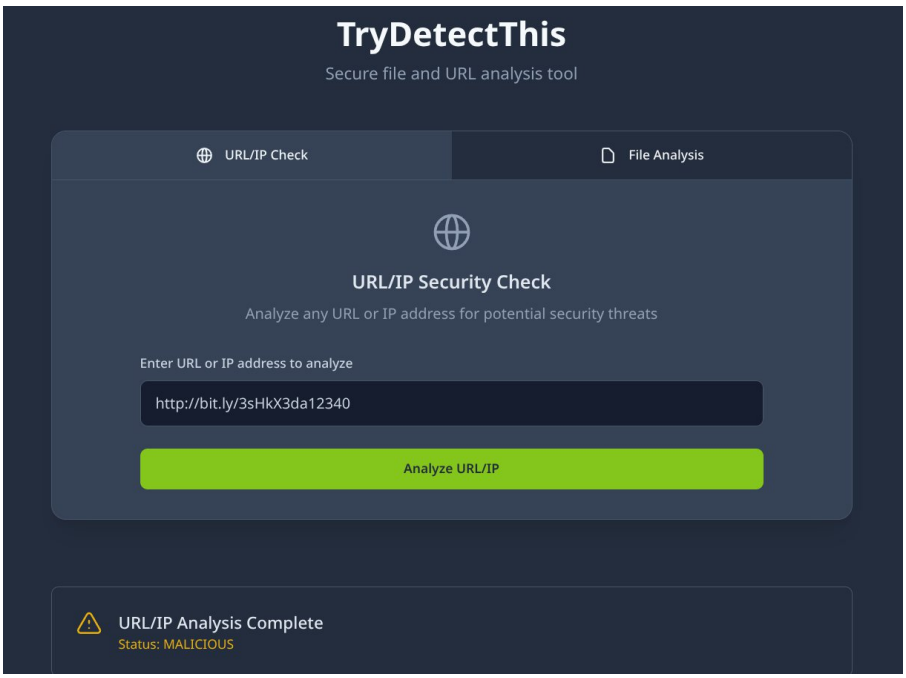

Analysis Steps:

The logs within Splunk were filtered by data source and sender to find the email which triggered the alert:
* datasource=email sender="urgents@amazon.biz"

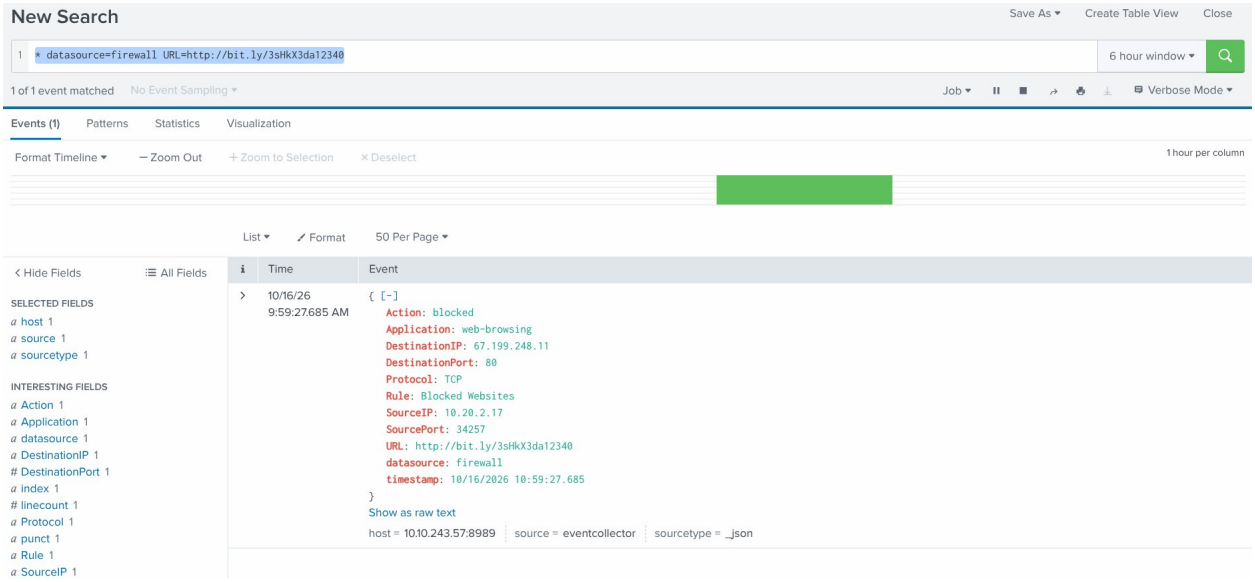

The sender of the email attempts to impersonate as Amazon. They include urgent wording which is a common tactic in phishing emails. They use a bitly shortened URL which is not in-line with legitimate business practice and a common obfuscation tactic. The attacker is likely attempting to harvest personal/shipping details from the user.

To evidence this being the case the URL was checked against internal threat intelligence and was found to be malicious.

Therefore, it was deemed necessary to search Firewall logs. It was found that the Firewall successfully blocked the user's attempt to access the malicious URL.

* datasource=firewall URL=http://bit.ly/3sHkX3da12340

This information was enough to close the alert as a failed True Positive.

Report:

Time of activity:

Oct 16th 2026 at 11:00

List of Affected Entities:

Malicious Email Recipient: h.harris@thetrydaily.thm (10.20.2.17) (No other recipients found when searching the logs)

Reason for Classifying as True Positive:

The sender of the email is using impersonation to look like a legitimate Amazon email but on closer inspection this is not official Amazon infrastructure nor is this type of email common practice for Amazon. The link within the email also uses bitly URL shortening which is a common obfuscation tactic and not common practice for legitimate businesses. the email asked the recipient to confirm their shipping information, meaning the attacker's goal was to harvest the personal or shipping details the user would enter on the linked page. When checking our internal threat intelligence the link was found to be associated with malicious activities. The Firewall was, however, able to prevent the malicious URL from being accessed.

Reason for Escalating the Alert:

As the Firewall successfully blocked access of the malicious URL there is no need for escalation.

Recommended Remediation Actions:

It is important that employees have a strong awareness of what phishing emails look like to help prevent the risk of an attacker achieving initial access via this method. It may be worth running simulated phishing training and ensuring employees are well informed on how to spot these types of email.

List of Attack Indicators:

Malicious Email Recipient: h.harris@thetrydaily.thm (10.20.2.17)

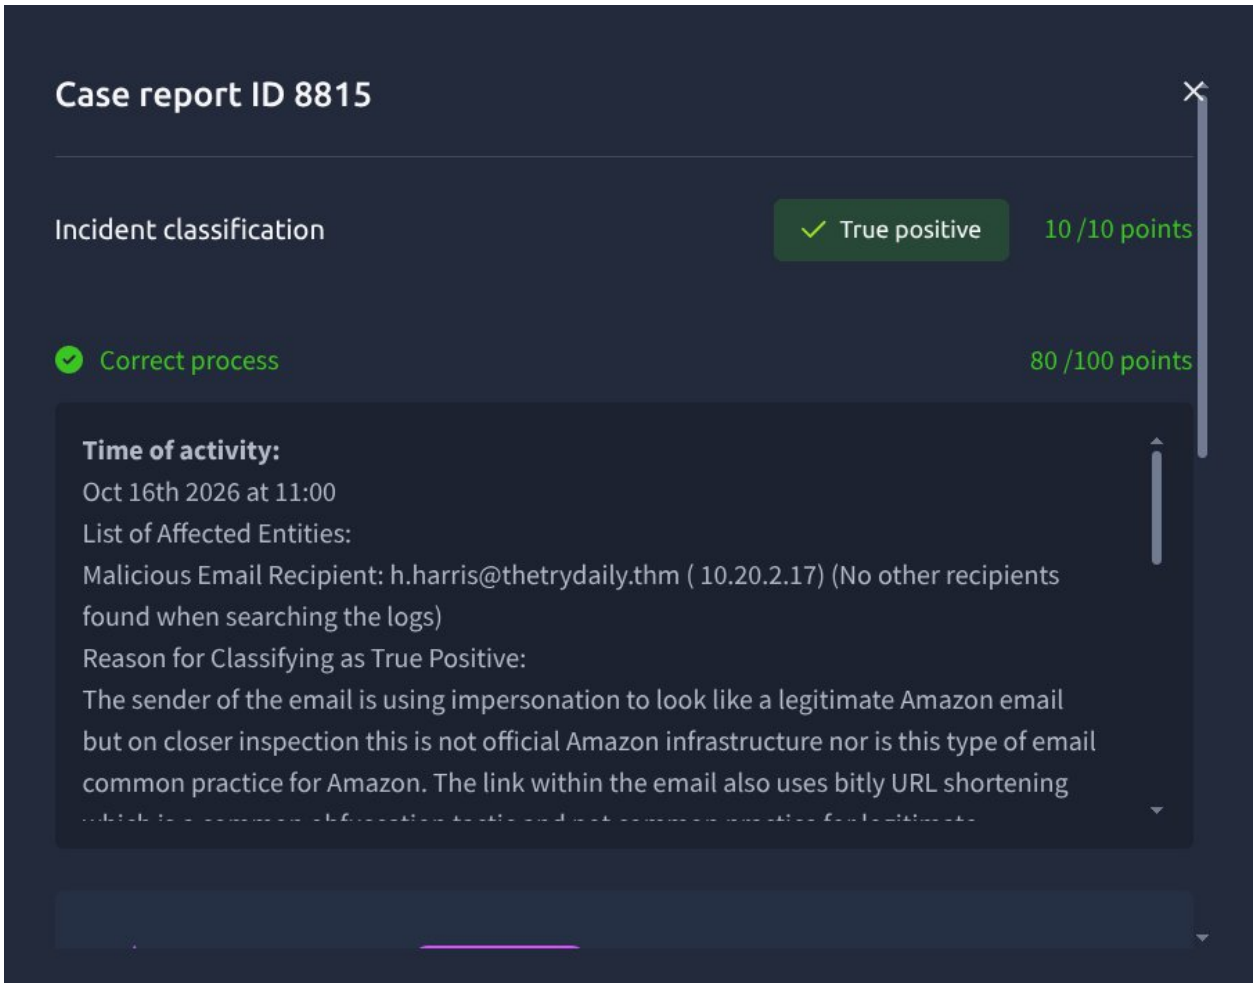

Sender: urgents@amazon.biz

Malicious URL: http://bit[.]ly/3sHkX3da12340 (67[.]199.248.11)

DestinationPort: 80

Protocol: TCP
