Event Information:

Description:

This alert was triggered by an inbound email contains one or more external links due to potentially suspicious characteristics. As part of the investigation, check firewall or proxy logs to determine whether any endpoints have attempted to access the URLs in the email and whether those connections were allowed or blocked.

Inbound

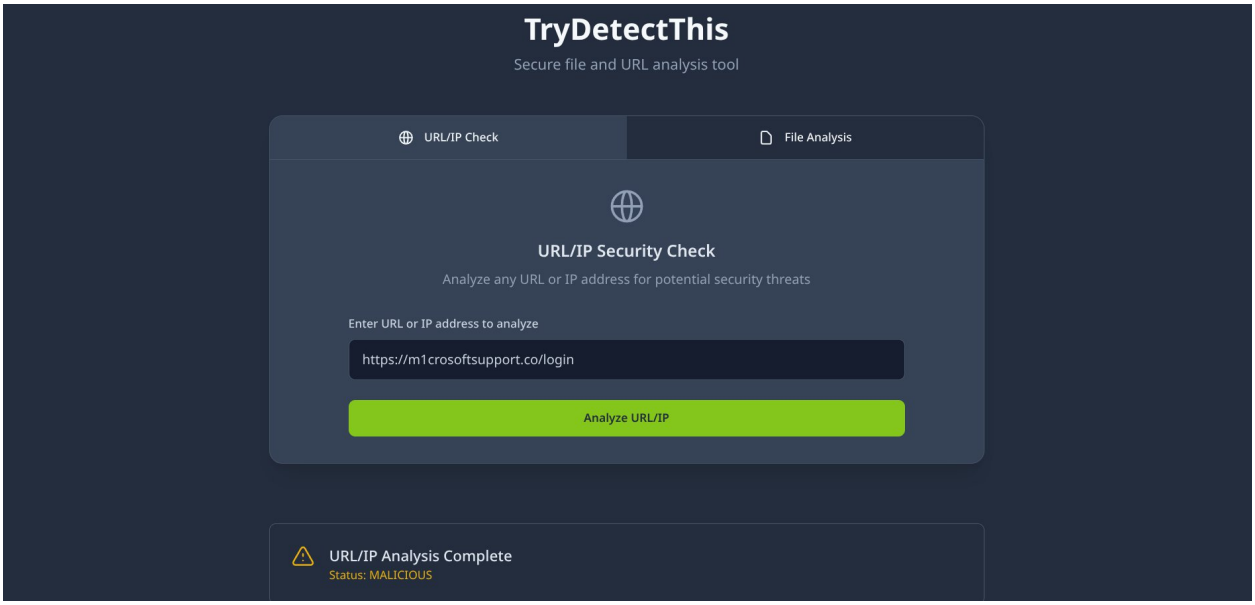

Analysis Steps:

The logs within Splunk were filtered by data source and sender to find the email which triggered the alert:
* datasource=email sender="no-reply@m1crosoftsupport.co"

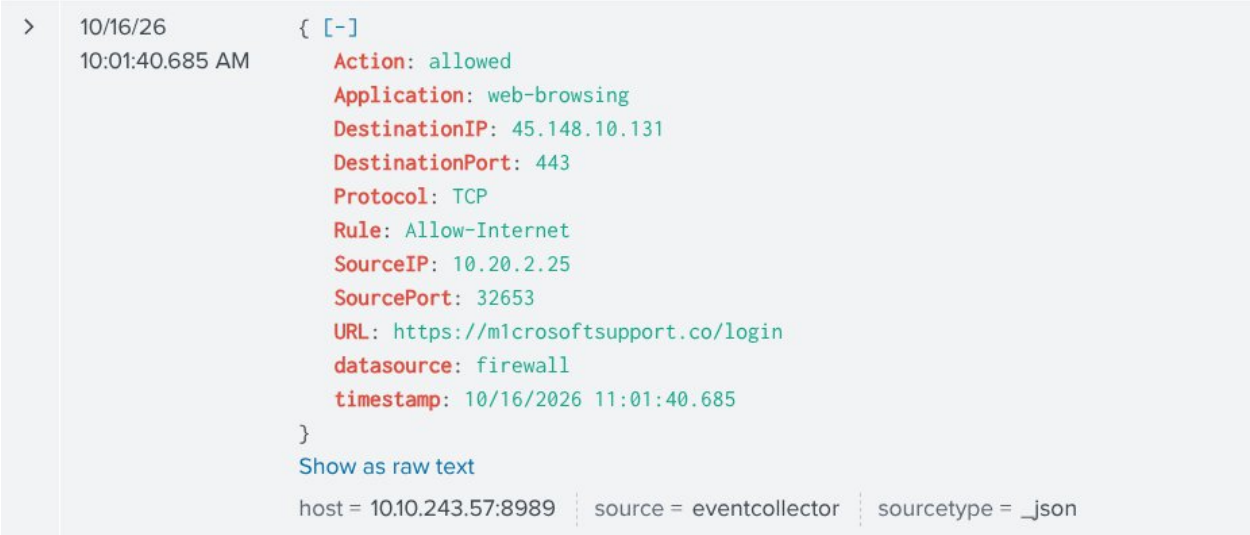

The sender of the email attempts to impersonate as Microsoft. The using naming that attempts to mimic official Microsoft naming conventions at a glance but switching out the i in Microsoft for a 1 (no-reply@m1crosoftsupport[.]co) which makes it obvious that this is phishing.

To evidence this being the case the URL was checked against internal threat intelligence and was found to be malicious.

Therefore, it was deemed necessary to search Firewall logs. It was found that the Firewall did not block the user's attempt to access the malicious URL.

* datasource=firewall URL="https://m1crosoftsupport.co/login"

This information was enough to escalate the alert as a True Positive and immediate remediation action including password reset should be taken.

Report:

Time of activity:
October 16, 2026, at 11:00:31.

List of Affected Entities:
The malicious email recipient is c.allen@thetrydaily.thm, and the endpoint source IP is 10.20.2.25.

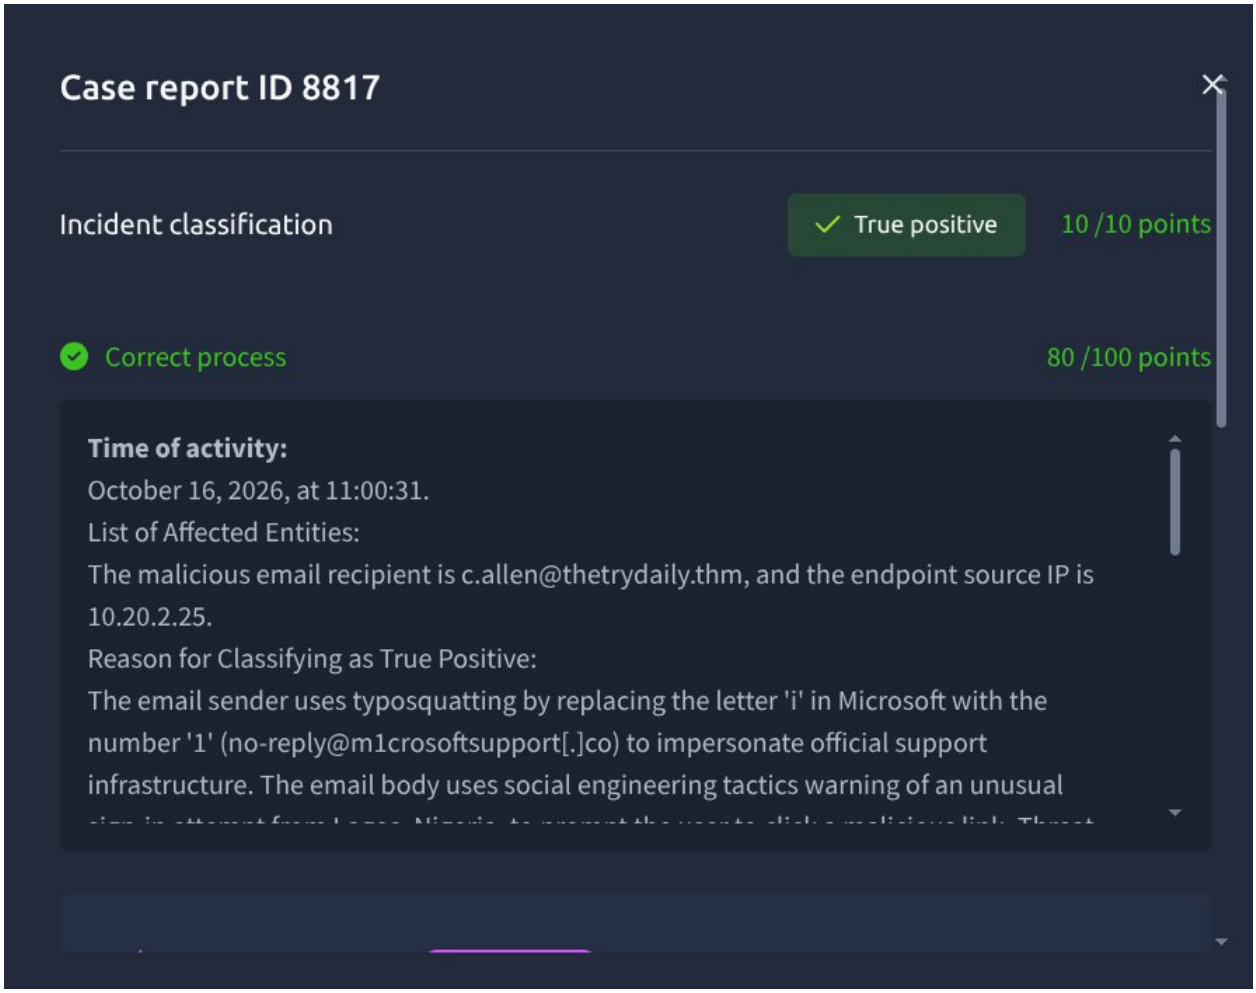

Reason for Classifying as True Positive:
The email sender uses typosquatting by replacing the letter 'i' in Microsoft with the number '1' (no-reply@m1crosoftsupport[.]co) to impersonate official support infrastructure. The email body uses social engineering tactics warning of an unusual sign-in attempt from Lagos, Nigeria, to prompt the user to click a malicious link. Threat intelligence analysis confirmed that the embedded URL (https://m1crosoftsupport[.]co/login) is malicious. Furthermore, firewall logs verified that the endpoint attempted to access the URL and the connection was allowed under the Allow-Internet rule.

Reason for Escalating the Alert:
The alert is escalated as a True Positive because the phishing email was successfully received, the embedded link is verified malicious, and firewall logs confirm the user's browser connection to the malicious domain was permitted rather than blocked.

Recommended Remediation Actions:
Execute an immediate password reset for the affected user account (c.allen@thetrydaily.thm). Audit account authentication and access logs to determine if credentials were submitted or if any unauthorized sessions occurred following the click. Provide ongoing security awareness training emphasizing how to spot phishing attempts, typosquatting domains, and fraudulent security alerts.

List of Attack Indicators:
The recipient is c.allen@thetrydaily.thm with source IP 10.20.2.25.
The sender is no-reply@m1crosoftsupport[.]co.
The email subject is Unusual Sign-In Activity on Your Microsoft Account.
The malicious URL is https://m1crosoftsupport[.]co/login. The destination IP is 45[.]148.10.131, the destination port is 443, and the protocol is TCP.
